FAI Syndrome: what make it so special & common pitfalls in management

FAI Syndrome is fast becoming a far more common condition that many clinicians are seeing day to day but what makes it so special?

What sets FAIS apart from other hip pathologies and how can clinicians pick up these issues with patients

even when they don't see them too often?

This webinar will cover all the key identifiable features that helps us differentiate for an FAI(S) diagnosis; when and what imaging to refer for and the potential limitations around this.

We will also touch on the common pitfalls that come to light when managing individuals with this condition.

7-9.30pm CET
